

Remsoft's **Model Diagnostics** Service

Is your model sound, error-free and running at its maximum potential?

Remsoft provides a “model review” service to our clients who subscribe to the Remsoft Maintenance Program.

Our goal is to help you get the most from your model by:

- improving model performance (saving time and \$)
- being confident your model is doing what you want it to do
- taking advantage of current best practices in model building
- making sure your model is fast and efficient

Model Diagnostics Service includes:

- Missing yields: check that all developments are assigned yields.
- Identify opportunities to reduce matrix size.
- Check outputs used in the Optimize section: verify that the output values correspond between matrix and model.
- Performance: Identify bottlenecks in running models including yields and outputs; look for opportunities to reformulate.
- Check model log files and address any warnings found.
- Check for shapefile problems.

A summary of our analysis will be available along with suggestions for next steps after the review is completed. An on-line web conference to explain the report and next steps is also included in the price.

For pricing and further information please contact Sandy@remsoft.com for more information.
